## Sets

A set is a collection of things called elements. A set is denoted two ways: explicitly:  $C = \{1, 4, q, \text{Dennis}, \alpha\}$ ,  $D = \{4.7, \pi, \text{"The"}, \{4, 7, 10\}, \text{Dennis}\}$   
with set builder notation: i.e.  $\{x | P(x) \text{ is true}\}$  then  $P(x)$  is some predicate taking  $x$  as the variable

Eg:  $E = \{x | x^2 = 4\} = \{2, -2\}$

$F = \{\pi | \pi \text{ has 4 elements and 4 cycles}\} = \{(12)(24), (13)(24), (14)(23), (1)(234), (1)(243), (2)(134), (2)(143), (3)(124), (3)(142), (4)(123), (4)(132)\}$

(In each case, the universe of discourse is the obvious one: Real #'s and permutations on the set  $\{1, 2, 3, 4\}$  resp.)

We usually name sets with capital letters

E.g.  $A = \{x | x^2 = 4\}$

$B = \{y | y > 0\}$

If  $A$  is a set then we denote by  $|A|$  the number of elements in  $A$ , also called the cardinality of  $A$ .

$|C| = 5$   $|D| = 5$   $|E| = 2$   $|F| = 11$

Def: if  $x$  is an element of set  $A$  then we write  $x \in A$ .

T/F  $(12)(34) \in F = T$

T/F  $(21)(43) \in F = T$

T/F  $(12)(3)(4) \in F = F$

T/F  $3 \in \{y | y^2 > y^2 - 1\} \cup \text{of } D | R$

Some sets of numbers you must know and love(optional)

$|R = \text{real #'s} = \{x | x \text{ is on the number line}\}$  (i.e every number in sight)

$|Z = \text{integers} = \{\dots -2, -1, 0, 1, 2, \dots\}$

$|Q = \text{rationals} = \{a/b | a \in |Z, b \in |Z, b \neq 0\}$

$|N = \text{natural} = \{0, 1, 2, 3, \dots\}$

$|C = \text{complex}$
